Chapter 16: Loci (Locus and its Constructions)

Every formula and result of the chapter on one sheet

1	Equidistant from two points	Perpendicular bisector of the segment joining them
2	Equidistant from two intersecting lines	The pair of angle bisectors
3	Fixed distance from a point	Circle with that point as centre
4	Fixed distance from a line	Pair of parallel lines, one on each side
5	Equidistant from two parallel lines	The parallel line midway between them
6	Circumcentre	Meeting point of the perpendicular bisectors of the sides; equidistant from the vertices
7	Incentre	Meeting point of the angle bisectors; equidistant from the sides
8	Point satisfying two conditions	Intersection of the two loci
9	Centre of a circle through two points	Lies on the perpendicular bisector of the segment joining them
10	Centre of a circle touching two intersecting lines	Lies on a bisector of the angle between them
