Chapter 9: Some Applications of Trigonometry

Step-by-step solutions to the textbook exercises: 15 questions

Questions are numbered as in the textbook. Try each one yourself before reading the solution.

1 Exercise 9.1

- Q1** A 20 m rope is stretched tight from the top of a vertical pole to the ground and makes an angle of 30° with the ground. Find the height of the pole.

SOLUTION

Let AB be the pole and AC the rope. In right triangle ABC , $\sin 30^\circ = \frac{AB}{AC}$.

$$\frac{1}{2} = \frac{AB}{20}, \text{ so } AB = 10 \text{ m.}$$

Answer: 10 m

- Q2** A tree breaks in a storm and its top touches the ground 8 m from the foot of the tree, making an angle of 30° with the ground. Find the height of the tree.

SOLUTION

Let the tree break at a height h , and let the broken part have length l . The standing part, the ground and the broken part form a right triangle with base 8 m.

$$\tan 30^\circ = \frac{h}{8} \text{ gives } h = \frac{8}{\sqrt{3}} \text{ m. } \cos 30^\circ = \frac{8}{l} \text{ gives } l = \frac{16}{\sqrt{3}} \text{ m.}$$

$$\text{Height of the tree} = h + l = \frac{24}{\sqrt{3}} = 8\sqrt{3} \text{ m.}$$

Answer: $8\sqrt{3}$ m (about 13.86 m)

- Q3** Two slides are planned in a park: one whose top is 1.5 m high and inclined at 30° to the ground, and a steeper one whose top is 3 m high and inclined at 60° . Find the length of each slide.

SOLUTION

In each case the slide is the hypotenuse and the height is the side opposite the angle, so

$$\text{length} = \frac{\text{height}}{\sin \theta}.$$

$$\text{First slide: } \frac{1.5}{\sin 30^\circ} = \frac{1.5}{1/2} = 3 \text{ m. Second slide: } \frac{3}{\sin 60^\circ} = \frac{3 \times 2}{\sqrt{3}} = 2\sqrt{3} \text{ m.}$$

Answer: 3 m and $2\sqrt{3}$ m

- Q4** The angle of elevation of the top of a tower from a point on the ground 30 m from its foot is 30° . Find the height of the tower.

SOLUTION

$$\tan 30^\circ = \frac{h}{30}, \text{ so } h = \frac{30}{\sqrt{3}} = 10\sqrt{3} \text{ m.}$$

Answer: $10\sqrt{3}$ m

- Q5** A kite flies 60 m above the ground. Its string is tied to a point on the ground and makes an angle of 60° with the ground. Find the length of the string, assuming it is straight.

SOLUTION

$$\sin 60^\circ = \frac{60}{l}, \text{ so } l = \frac{60 \times 2}{\sqrt{3}} = 40\sqrt{3} \text{ m.}$$

Answer: $40\sqrt{3}$ m

- Q6** A boy 1.5 m tall stands some distance from a 30 m tall building. As he walks towards it, the angle of elevation of its top from his eyes increases from 30° to 60° . How far did he walk?

SOLUTION

The top of the building is $30 - 1.5 = 28.5$ m above his eye level.

$$\text{At } 30^\circ \text{ his distance from the building is } \frac{28.5}{\tan 30^\circ} = 28.5\sqrt{3} \text{ m. At } 60^\circ \text{ it is } \frac{28.5}{\tan 60^\circ} = \frac{28.5}{\sqrt{3}} \text{ m.}$$

$$\text{Distance walked} = 28.5\sqrt{3} - \frac{28.5}{\sqrt{3}} = \frac{28.5 \times 2}{\sqrt{3}} = \frac{57}{\sqrt{3}} = 19\sqrt{3} \text{ m.}$$

Answer: $19\sqrt{3}$ m

- Q7** From a point on the ground, the angles of elevation of the bottom and the top of a transmission tower fixed on a 20 m high building are 45° and 60° . Find the height of the tower.

SOLUTION

Let the point be d m from the building and the tower be h m high.

$$\tan 45^\circ = \frac{20}{d} \text{ gives } d = 20. \tan 60^\circ = \frac{20 + h}{d} \text{ gives } 20 + h = 20\sqrt{3}.$$

Answer: $h = 20(\sqrt{3} - 1)$ m (about 14.64 m)

Q8 A statue 1.6 m tall stands on a pedestal. From a point on the ground the angle of elevation of the top of the statue is 60° and that of the top of the pedestal is 45° . Find the height of the pedestal.

SOLUTION

Let the pedestal be h m high and the point be d m away. $\tan 45^\circ = \frac{h}{d}$ gives $d = h$.

$$\tan 60^\circ = \frac{h + 1.6}{h} \text{ gives } h\sqrt{3} = h + 1.6, \text{ so } h = \frac{1.6}{\sqrt{3} - 1} = \frac{1.6(\sqrt{3} + 1)}{2} = 0.8(\sqrt{3} + 1).$$

Answer: $0.8(\sqrt{3} + 1)$ m (about 2.19 m)

Q9 The angle of elevation of the top of a building from the foot of a tower is 30° , and the angle of elevation of the top of the tower from the foot of the building is 60° . The tower is 50 m high. Find the height of the building.

SOLUTION

Let the distance between them be d m and the building be h m high.

$$\tan 60^\circ = \frac{50}{d} \text{ gives } d = \frac{50}{\sqrt{3}}. \tan 30^\circ = \frac{h}{d} \text{ gives } h = \frac{d}{\sqrt{3}} = \frac{50}{3}.$$

Answer: $16\frac{2}{3}$ m

Q10 Two poles of equal height stand on opposite sides of a road 80 m wide. From a point on the road between them, the angles of elevation of their tops are 60° and 30° . Find the height of the poles and the distances of the point from them.

SOLUTION

Let each pole be h m high and the point be x m from the pole seen at 60° , so $(80 - x)$ m from the other.

$$\tan 60^\circ = \frac{h}{x} \text{ gives } h = \sqrt{3}x. \tan 30^\circ = \frac{h}{80 - x} \text{ gives } h = \frac{80 - x}{\sqrt{3}}.$$

So $3x = 80 - x$, $x = 20$ and $h = 20\sqrt{3}$.

Answer: the poles are $20\sqrt{3}$ m high, and the point is 20 m and 60 m from them

- Q11** A TV tower stands on one bank of a canal. From the point directly opposite on the other bank the angle of elevation of its top is 60° . From a point 20 m further back on the same line the angle is 30° . Find the height of the tower and the width of the canal.

SOLUTION

Let $AB = h$ be the tower and $BC = x$ the width of the canal, with $CD = 20$ m.

In $\triangle ABC$: $\tan 60^\circ = \frac{h}{x}$, so $h = \sqrt{3}x$. In $\triangle ABD$: $\tan 30^\circ = \frac{h}{x+20}$, so $x+20 = \sqrt{3}h = 3x$.

So $x = 10$ and $h = 10\sqrt{3}$.

Answer: the tower is $10\sqrt{3}$ m high and the canal is 10 m wide

- Q12** From the top of a 7 m high building, the angle of elevation of the top of a cable tower is 60° and the angle of depression of its foot is 45° . Find the height of the tower.

SOLUTION

Let the horizontal distance be d m. The angle of depression of the foot is 45° , so $\tan 45^\circ = \frac{7}{d}$ and $d = 7$.

The part of the tower above the level of the building top is $d \tan 60^\circ = 7\sqrt{3}$ m.

Answer: $7 + 7\sqrt{3} = 7(\sqrt{3} + 1)$ m (about 19.12 m)

- Q13** From the top of a lighthouse 75 m above sea level, the angles of depression of two ships are 30° and 45° . One ship is exactly behind the other on the same side. Find the distance between the ships.

SOLUTION

The ship seen at 45° is $\frac{75}{\tan 45^\circ} = 75$ m from the foot of the lighthouse. The ship seen at 30° is $\frac{75}{\tan 30^\circ} = 75\sqrt{3}$ m away.

Answer: $75\sqrt{3} - 75 = 75(\sqrt{3} - 1)$ m (about 54.9 m)

Q14 A girl 1.2 m tall sees a balloon moving in a horizontal line at a height of 88.2 m. The angle of elevation of the balloon from her eyes is 60° and, some time later, 30° . Find the distance travelled by the balloon in that time.

SOLUTION

The balloon is $88.2 - 1.2 = 87$ m above her eye level.

Horizontal distance at 60° : $\frac{87}{\tan 60^\circ} = \frac{87}{\sqrt{3}} = 29\sqrt{3}$ m. At 30° : $\frac{87}{\tan 30^\circ} = 87\sqrt{3}$ m.

Answer: $87\sqrt{3} - 29\sqrt{3} = 58\sqrt{3}$ m

Q15 A straight highway leads to the foot of a tower. From the top of the tower a car is seen at an angle of depression of 30° , approaching at a uniform speed. Six seconds later the angle of depression is 60° . How much more time does the car take to reach the foot of the tower?

SOLUTION

Let the tower be h m high. The car is first $\frac{h}{\tan 30^\circ} = \sqrt{3}h$ away and then $\frac{h}{\tan 60^\circ} = \frac{h}{\sqrt{3}}$ away.

In 6 seconds it covers $\sqrt{3}h - \frac{h}{\sqrt{3}} = \frac{2h}{\sqrt{3}}$. The remaining distance $\frac{h}{\sqrt{3}}$ is half of this, so at the same speed it takes half the time.

Answer: 3 seconds

The questions are restated in MathSetu's own words and the figures are redrawn; refer to the textbook for the original wording. The solutions are MathSetu's own. MathSetu is an independent study resource and is not affiliated with or endorsed by NCERT, CBSE or any publisher.
